Because some cases have multiple vaccinations and symptoms, a single case can account for multiple entries in this table. This is the reason why the Total Count is greater than 29 (the number of cases found), and the Total Percentage is greater than 100.

Case Details

VAERS ID: [383270](history)  Vaccinated: 2010-02-09  Life Threatening? No
Age: 16.0  Onset: 2010-02-11, Days after vaccination: 2  Died? No

Symptoms: Biopsy muscle abnormal, Blood creatine phosphokinase increased, Central nervous system lesion, Disturbance in social behaviour, Eye movement disorder, Irritability, Myofascitis, Nuclear magnetic resonance imaging brain abnormal

SMQs: Rhabdomyolysis/myopathy (broad), Neuroleptic malignant syndrome (broad), Myocardial infarction (broad), Dementia (broad), Malignancy related therapeutic and diagnostic procedures (narrow), Drug abuse and dependence (broad), Guillain-Barre syndrome (broad), Noninfectious encephalitis (broad), Noninfectious encephalopathy/delirium (broad), Noninfectious meningitis (broad), Hostility/agression (broad), Ocular motility disorders (narrow), Tendinopathies and ligament disorders (broad), Hypoglycaemia (broad)

Write-up: Patient became progressively more irritable over 24 hours. He then stopped interacting and had dancing eye movements. He was brought to the local hospital and underwent a neurologic workup yielding a diagnosis of possible Leigh Disease. He had a muscle biopsy that showed macrophagic myofasciitis that was attributed to the immunizations.

VAERS ID: 419564 (history)  Vaccinated: 2011-02-07

FLU3: INFLUENZA (SEASONAL) (FLUZONE HIGH-DOSE) | SANOFI PASTEUR | 111 | IM | LA |

Administered by: Public Purchased by: Other
Symptoms: Blood test, Bronchoscopy, Platelet count decreased, Pulmonary haemorrhage, Thrombocytopenia, White blood cell count decreased
SMQs: Haematopoietic leukopenia (narrow), Haematopoietic thrombocytopenia (narrow), Haemorrhage terms (excl laboratory terms) (narrow), Systemic lupus erythematosus (narrow), Drug reaction with eosinophilia and systemic symptoms syndrome (broad)

Write-up: I got my Flu shot around 3 in the afternoon on Sept 16th, and was in our local ER bleeding from my lung that night. Doc's at hospital (was shipped via ambulance from our local hospital) came in next day telling me my WHITE BLOOD CELL COUNT WAS LOW AND CONCERNED THEM (I highlighted in Red the first "reaction" shown in the box below)...So for a short "window of time" after the Flu shot (approx. 24 hours all told), these things happened. Thrombocytopenia (abnormally low platelet count, which can result in abnormal bleeding) My note: this is what happened to me after getting Flu shot earlier in the day...I had a LOW white cell count that concerned Docs the following day! And was bleeding from my left lung! One of the Serious adverse events in your package insert. I definitely will never get another Flu shot of any kind for any reason. I was NOT informed that the shot I was getting was 4 times the amount of flu bug as the regular shots...I feel like a guinea pig being used for experimentation without my knowledge or consent! Apparently the injection set my white cells on the attack due to your products invasion, and I could not produce them fast enough, resulting in the LOW cell count, resulting in the bleeding...

**Write-up:** He started running a fever on November 16th, that night he woke up screaming several times, his eyes were all glazed over, and he was petrified. I thought they were just nightmares. The morning of November 18th, he was taken by ambulance to the hospital following a grand mal seizure. He went on to have multiple seizures at the hospital, and was transferred to another facility. At first they were calling them febrile seizures until they diagnosed him with epilepsy. The cause of his fever is still unknown, but I believe the vaccines he had on Nov 9 may have caused the fever, and brought on the seizures.

Write-up: According to the patient this report may have been submitted by MD
seen at time of adverse event. It was reported that the client began to develop
itchiness after the immunization was given. Soon after numbness began to
develop in the left shoulder and continued down the arm. Client reports that the
numbness was on the left side down to his waist. Client reported having been seen
at another facility where he was diagnosed with transverse myelitis and given IV
Solumedrol during hospital stay. Client reports having improved with only
numbness in the left fingertips as of today. Client states he was sent home with a
prescription for steroids PO. Follow-up scheduled.

Symptoms: Anxiety, Depression, Dizziness, Electromyogram, Headache, Hypoaesthesia, Malaise, Muscular weakness, Nuclear magnetic resonance imaging brain, Nuclear magnetic resonance imaging spinal, Paraesthesia

SMQs: Rhabdomyolysis/myopathy (broad), Peripheral neuropathy (broad), Anticholinergic syndrome (broad), Guillain-Barre syndrome (broad), Noninfectious encephalopathy/delirium (broad), Depression (excl suicide and self injury) (narrow), Vestibular disorders (broad), Hypoglycaemia (broad)

Write-up: Please see physician records; acute onset of headache, dizziness, general malaise followed by acute bilateral upper extremity paresthesias (numbness and tingling, mild component of weakness). Symptoms listed first
were gone within 48 hours of the vaccine administration time. However, upper extremity paresthesias persisted—very intense for about 1-2 weeks with a gradual decrease in symptoms at 2-3 weeks and minimal symptoms after 3-4 weeks and nearly complete resolution of symptoms about 5-6 weeks later. Also caused anxiety and depression, secondary to symptoms.

Symptoms: Burning sensation, Exfoliative rash, Laboratory test, Pityriasis rubra pilaris, Rash erythematous, Rash pruritic

SMQs: Severe cutaneous adverse reactions (narrow), Anaphylactic reaction (broad), Peripheral neuropathy (broad), Hypersensitivity (narrow), Drug reaction with eosinophilia and systemic symptoms syndrome (broad)

Write-up: Initial unsolicited report received from a healthcare professional on 3 August 2015. A 59-year-old male patient had received a first dose of ADACEL (batch number, route of administration not reported) in right deltoid on 8 July 2015. The patient's illness at the time of vaccination, pre-existing physician diagnosed allergies, birth defects, medical conditions were reported as none and concomitant medication were reported as none. On 17 July 2015, nine days after vaccination, the patient developed a red scaling rash that had spread starting from his head progressing to his face and then full trunk. It both itches and burns. The patient was diagnosed with pityriasis rubra pilaris. Reporter consider it as a life-threatening illness. The patient required ER visit. The patient had tried triamcinolone cream without success as corrective treatment and was concerned that this may lead to more serious physical conditions such as liver and spleen enlargement. The patient's blood work is pending and he is being seen as a case at a symposium this week for evaluation and treatment. Laboratory investigations were reported as "labs". At the time of this report, the event outcome was not recovered. Documents held by sender: none.
